

# Winning Space Race with Data Science

Pablo Posada Sept 2021

#### Outline

- Executive Summary
- Introduction
- Methodology
- Results
- Conclusion
- Appendix

#### **Executive Summary**

#### Methodologies

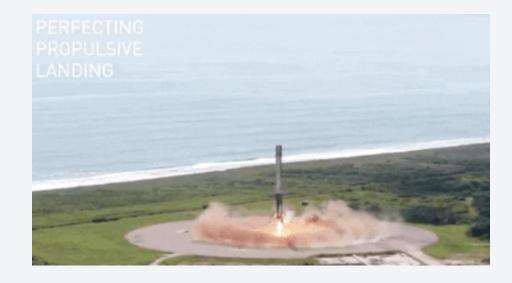

- Data collection through API
- Data collection with web scraping
- Data wrangling and exploratory data analysis (EDA)
- Visualizations
- Predictive analysis with machine learning

#### Results

- Success/Fail plots
- SQL queries
- Launch site locations/history
- Machine learning model selection

#### Introduction

Space X advertises Falcon 9 rocket launches on its website with a cost of 62 million dollars; other providers cost upward of 165 million dollars each

Much of the savings is because Space X can reuse the first stage.

If we can determine if the first stage will land, we can determine the cost of a launch.

## Methodology

#### **Executive Summary**

- Data collection methodology:
  - Collection using SpaceX API.
  - Collection using web scraping.
- Perform data wrangling
  - Extract Falcon 9 launch records HTML table from Wikipedia.
  - Parsing the table and conversion into a Pandas data frame.
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models

#### **Data Collection**

Decode the response Request to the **API** content to create SpaceX API url dataframe Web Create a dataframe by **Get HTTP** scraping parsing the HTML tables response

#### Data Collection - SpaceX API

Start requesting rocket launch data from SpaceX API with the following URL.

To make the requested JSON results more consistent, we used a static response object.

We decoded the response content as a Json using .json and turn it into a Pandas dataframe using .json\_normalize().

```
[17]: spacex_url="https://api.spacexdata.com/v4/launches/past"
     [18]: response = requests.get(spacex_url)
[20]: static_json_url='https://cf-courses-data.s3.us.cloud-object-storage.appdomain.cloud/IBM-DS0321EN-SkillsNetwork
     [25]: # Use json normalize meethod to convert the json result into a dataframe
            response=requests.get(static_json_url)
            response = response.json()
           response = pd.json_normalize(response)
           Using the dataframe data print the first 5 rows
     [26]: # Get the head of the dataframe
           data = pd.DataFrame(response)
            data.head()
```

#### **Data Collection - Scraping**

TASK 1: Request the Falcon9 Launch Wiki page from its URL

TASK 2: Extract all column/ variable names from the HTML table header

TASK 3: Create a data frame by parsing the launch HTML tables

Use HTTP GET method to request the Falcon9 Launch HTML page, then create a *BeautifulSoup* object from the HTML *response*.

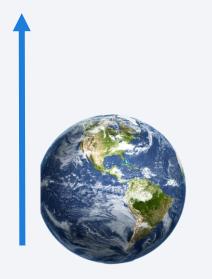

Find all tables on the wiki page first.

Iterate through the *>* elements and apply the *extract\_column\_from\_header()*`function to extract column name one by one.

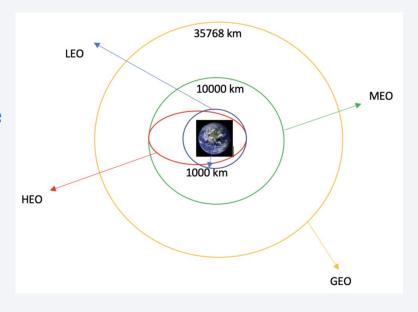

Create an empty dictionary with keys from the extracted column names. This dictionary is converted into a Pandas dataframe.

# **Data Wrangling**

TASK 2: Calculate the number and occurrence of each orbit

TASK 1: Calculate the number of launches on each site

TASK 3: Calculate the number and occurrence of mission outcome per orbit type

TASK 4: Create a landing outcome label

#### **EDA** with Data Visualization

Bar charts

To represent numerical and categorical variables grouped in intervals

Line plots

To emphasize changes in values for one variable (plotted on the vertical axis) for continuous values of a second variable (plotted on the horizontal) Scatter plots

To express a trend

#### **EDA** with SQL

- 1. Display the names of the unique launch sites in the space mission
- 2. Display 5 records where launch sites begin with the string 'CCA'
- 3. Display the total payload mass carried by boosters launched by NASA (CRS)
- 4. Display average payload mass carried by booster version F9 v1.1
- 5. List the date when the first successful landing outcome in ground pad was acheived.

#### **EDA** with SQL

- 6. Display the names of the unique launch sites in the space mission
- 7. List the total number of successful and failure mission outcomes
- 8. List the names of the booster versions which have carried the maximum payload mass
- 9. List the failed landing outcomes in drone ship, their booster versions, and launch site names for the in year 2015
- 10. Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad)) between the date 2010-06-04 and 2017-03-20

## Build an Interactive Map with Folium

Circles for places

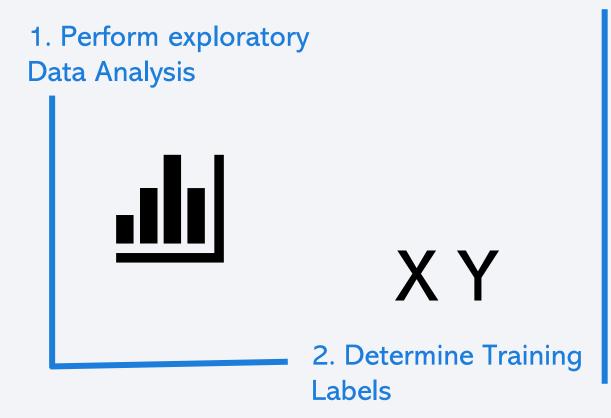

Markers for launchings

Color for success status

Lines to illustrate distances

## Predictive Analysis (Classification)

Logistic Regression

**SVM** 

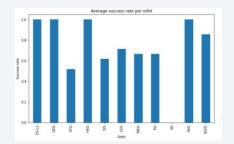

**Classification Trees** 

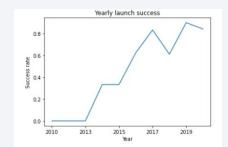

K-nearest neighbors

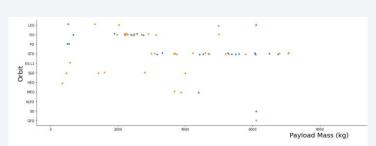

4. Choose the best model

#### Results

#### **EDA**

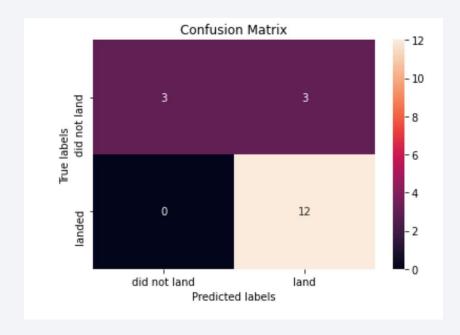

#### **Interactive Analytics**

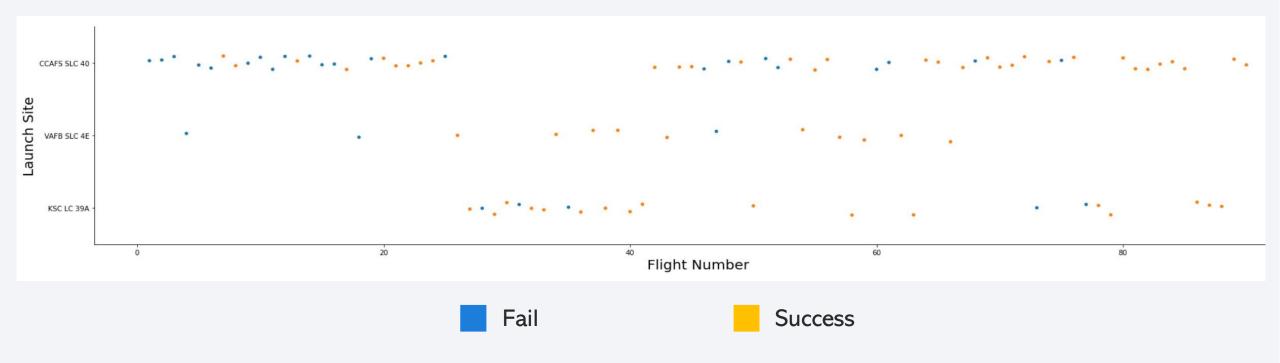

#### **Predictive Analysis**

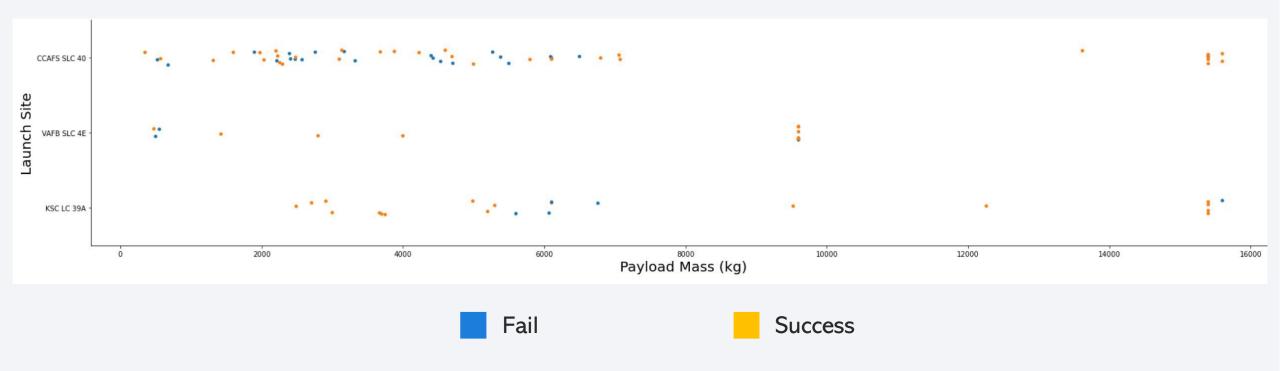

## Flight Number vs. Launch Site

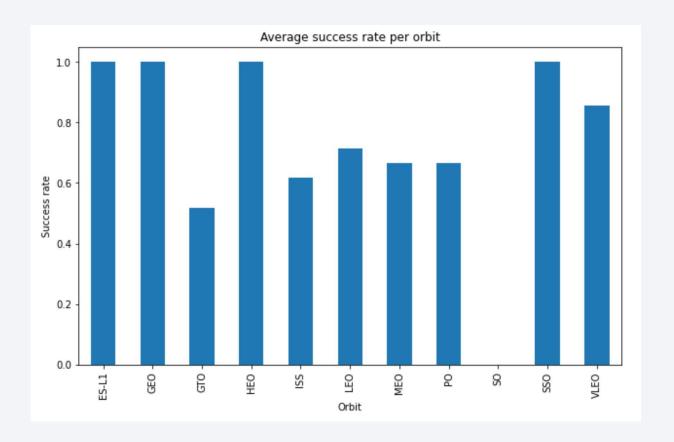

- VAFB SLC 4E is the least used Launch site
- Most of missions were successful after Flight 35

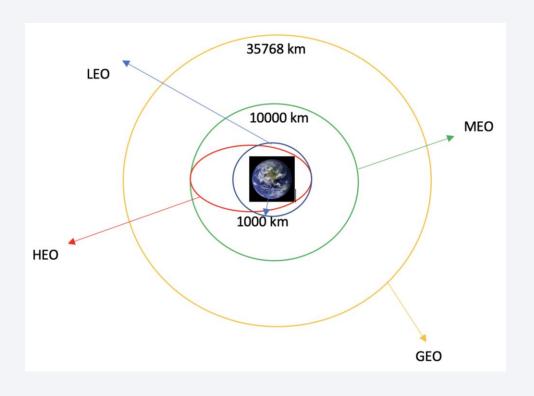

#### Payload vs. Launch Site

- Missions carrying more than 9000 kg are more likely to succeed
- The heaviest payloads are launched from CCAFS SLC 40 and KSC LC 39A

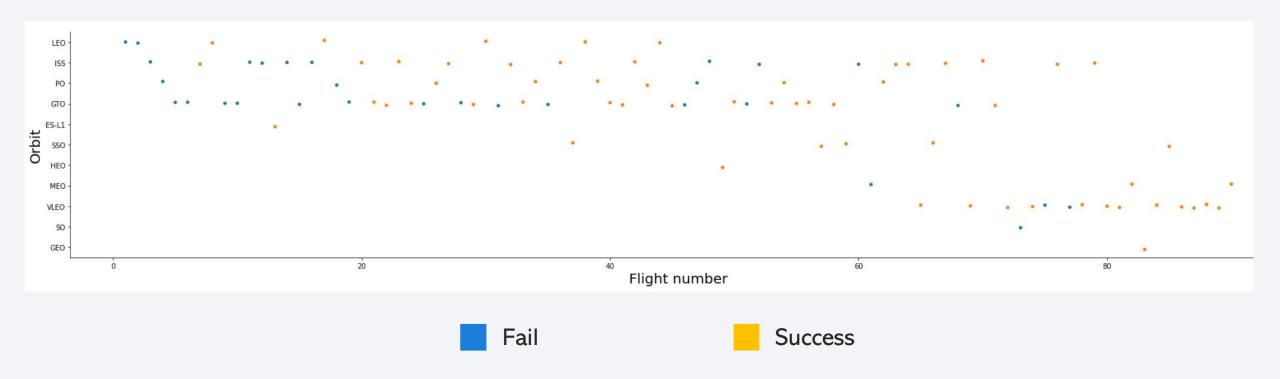

## Success Rate vs. Orbit Type

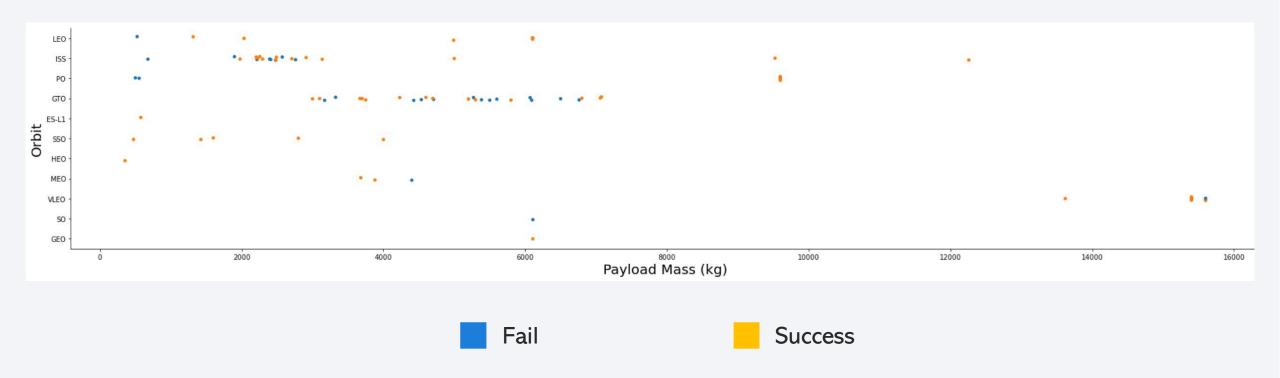

- ES-L1, GEO, HEO and SSO have almost perfect success rates
- Other orbits oscillate around 60% success

## Flight Number vs. Orbit Type

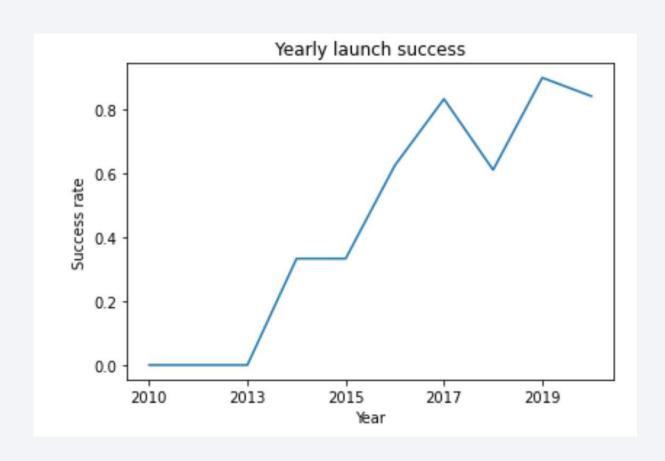

- LEO missions improved considerably over time
- There has been persistent problems related to missions going to GTO orbit

## Payload vs. Orbit Type

 Heavier payloads have a negative effect on GTO missions and a positive effect on PO, ISS and LEO

# Launch Success Yearly Trend

 Success rates kept increasing from 2013 to 2019

#### All Launch Site Names

```
%%sql
select distinct(LAUNCH_SITE) from SPAVCEXTBL
 * ibm_db_sa://fyn91381:***@ba99a9e6-d59e-4883-8fc0-d6a8c9f7a08f.
Done.
  launch_site
 CCAFS LC-40
CCAFS SLC-40
  KSC LC-39A
 VAFB SLC-4E
```

• We find 4 unique launch sites

# Launch Site Names Begin with 'CCA'

%%sql select * from SPAVCEXTBL where LAUNCH_SITE like 'CCA%' limit 5									
* ibm_db_sa://fyn91381:***@ba99a9e6-d59e-4883-8fc0-d6a8c9f7a08f.c1ogj3sd0tgtu0lqde00.databases.appdomain.cloud:31321/bludb Done.									
DATE	timeutc_	booster_version	launch_site	payload	payload_masskg_	orbit	customer	mission_outcome	landing_outcome
2010-06-04	18:45:00	F9 v1.0 B0003	CCAFS LC-40	Dragon Spacecraft Qualification Unit	0	LEO	SpaceX	Success	Failure (parachute)
2010-12-08	15:43:00	F9 v1.0 B0004	CCAFS LC-40	Dragon demo flight C1, two CubeSats, barrel of Brouere cheese	0	LEO (ISS)	NASA (COTS) NRO	Success	Failure (parachute)
2012-05-22	07:44:00	F9 v1.0 B0005	CCAFS LC-40	Dragon demo flight C2	525	LEO (ISS)	NASA (COTS)	Success	No attempt
2012-10-08	00:35:00	F9 v1.0 B0006	CCAFS LC-40	SpaceX CRS-1	500	LEO (ISS)	NASA (CRS)	Success	No attempt
2013-03-01	15:10:00	F9 v1.0 B0007	CCAFS LC-40	SpaceX CRS-2	677	LEO (ISS)	NASA (CRS)	Success	No attempt

• First 5 mission records where launch sites begin with `CCA`

## **Total Payload Mass**

```
%%sql
select sum(payload_mass__kg_) as total_payload_mass from SPAVCEXTBL
where customer ='NASA (CRS)'

* ibm_db_sa://fyn91381:***@ba99a9e6-d59e-4883-8fc0-d6a8c9f7a08f.c1ogj3s
Done.
total_payload_mass

45596
```

• The total payload (in kg) carried by boosters from NASA

#### Average Payload Mass by F9 v1.1

```
%%sql
select avg(payload_mass__kg_) as average_payload_mass from SPAVCEXTBL
where booster_version ='F9 v1.1'

* ibm_db_sa://fyn91381:***@ba99a9e6-d59e-4883-8fc0-d6a8c9f7a08f.clogj3s
Done.
average_payload_mass
2928
```

• booster version F9 v1.1 has carried an average payload mass of 2928 kg

## First Successful Ground Landing Date

```
%%sql
select DATE as Date, landing_outcome from SPAVCEXTBL
where landing outcome =
(select landing outcome from SPAVCEXTBL where landing outcome like'%pad%' limit 1 )
 * ibm db sa://fyn91381:***@ba99a9e6-d59e-4883-8fc0-d6a8c9f7a08f.c1ogj3sd0tgtu0lqde00.dat
Done.
     DATE
             landing_outcome
2015-12-22 Success (ground pad)
2016-07-18 Success (ground pad)
2017-02-19 Success (ground pad)
2017-05-01 Success (ground pad)
2017-06-03 Success (ground pad)
2017-08-14 Success (ground pad)
2017-09-07 Success (ground pad)
2017-12-15 Success (ground pad)
2018-01-08 Success (ground pad)
```

First successful landing outcome on ground pad achieved on 2015/12/22

#### Successful Drone Ship Landing with Payload between 4000 and 6000

List the names of the boosters which have success in drone ship and have payload mass greater than 4000 but less than 6000

```
%%sql
select BOOSTER_VERSION,LANDING__OUTCOME from SPAVCEXTBL
where LANDING__OUTCOME = 'Success (drone ship)'
and (PAYLOAD_MASS__KG_ between 4000 and 6000 )

* ibm_db_sa://fyn91381:***@ba99a9e6-d59e-4883-8fc0-d6a8c9f7a08f.clogj3sd0tgtu0lqde00.databases.appdomain.clou
Done.
booster_version landing__outcome
    F9 FT B1022 Success (drone ship)
    F9 FT B1021.2 Success (drone ship)
F9 FT B1021.2 Success (drone ship)
F9 FT B1031.2 Success (drone ship)
```

 There is a selection of booster versions that operates better when carrying payload mass greater than 4000 but less than 6000

#### Total Number of Successful and Failure Mission Outcomes

```
%%sql
SELECT
    COUNT(CASE WHEN MISSION_OUTCOME like'%Success%' then 1 ELSE NULL END) as "Success",
    COUNT(CASE WHEN MISSION_OUTCOME like'%Failure%' then 1 ELSE NULL END) as "Failure"
from SPAVCEXTBL

* ibm_db_sa://fyn91381:***@ba99a9e6-d59e-4883-8fc0-d6a8c9f7a08f.c1ogj3sd0tgtu0lqde00.da1
Done.

Success Failure

100 1
```

Outstanding success rate!

## **Boosters Carried Maximum Payload**

```
%%sql
select BOOSTER VERSION, PAYLOAD MASS KG from SPAVCEXTBL
where PAYLOAD MASS KG = (select max(PAYLOAD MASS KG) from SPAVCEXTBL)
order by BOOSTER VERSION
 * ibm_db_sa://fyn91381:***@ba99a9e6-d59e-4883-8fc0-d6a8c9f7a08f.c1ogj3sd0tg
Done.
booster version payload mass kg
  F9 B5 B1048.4
                          15600
  F9 B5 B1048.5
                           15600
  F9 B5 B1049.4
                           15600
  F9 B5 B1049.5
                          15600
  F9 B5 B1049.7
                          15600
  F9 B5 B1051.3
                          15600
  F9 B5 B1051.4
                          15600
  F9 B5 B1051.6
                          15600
                           15600
  F9 B5 B1056.4
  F9 B5 B1058.3
                           15600
  F9 B5 B1060.2
                           15600
  F9 B5 B1060.3
                          15600
```

 12 booster versions have carried the maximum payload mass

#### 2015 Launch Records

```
%%sql
select DATE, LANDING OUTCOME, BOOSTER VERSION, LAUNCH SITE from SPAVCEXTBL
where LANDING OUTCOME = 'Failure (drone ship)'
and YEAR(DATE) = 2015
 * ibm db sa://fyn91381:***@ba99a9e6-d59e-4883-8fc0-d6a8c9f7a08f.c1ogj3sd0tgtu
Done.
     DATE landing_outcome booster_version launch_site
2015-01-10 Failure (drone ship) F9 v1.1 B1012 CCAFS LC-40
2015-04-14 Failure (drone ship)
                            F9 v1.1 B1015 CCAFS LC-40
```

• Failed landing outcomes in drone ship during year 2015

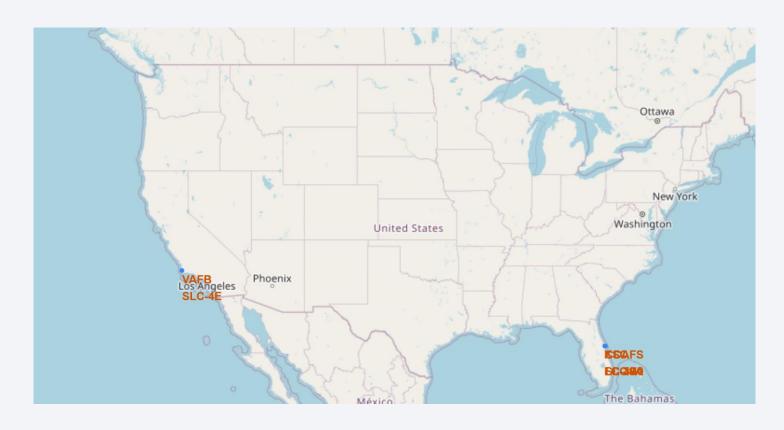

#### Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

```
%%sql
select LANDING OUTCOME, count(*) as count from SPAVCEXTBL
where DATE between '2010-06-04' AND '2017-03-20'
group by LANDING OUTCOME
order by 2 desc
 * ibm db sa://fyn91381:***@ba99a9e6-d59e-4883-8fc0-d6a8c9f7a0
Done.
  landing_outcome COUNT
         No attempt
                         10
   Failure (drone ship)
  Success (drone ship)
                          5
   Controlled (ocean)
                          3
 Success (ground pad)
                          3
   Failure (parachute)
 Uncontrolled (ocean)
                          2
Precluded (drone ship)
```

 Count of landing outcomes between 2010-06-04 and 2017-03-20

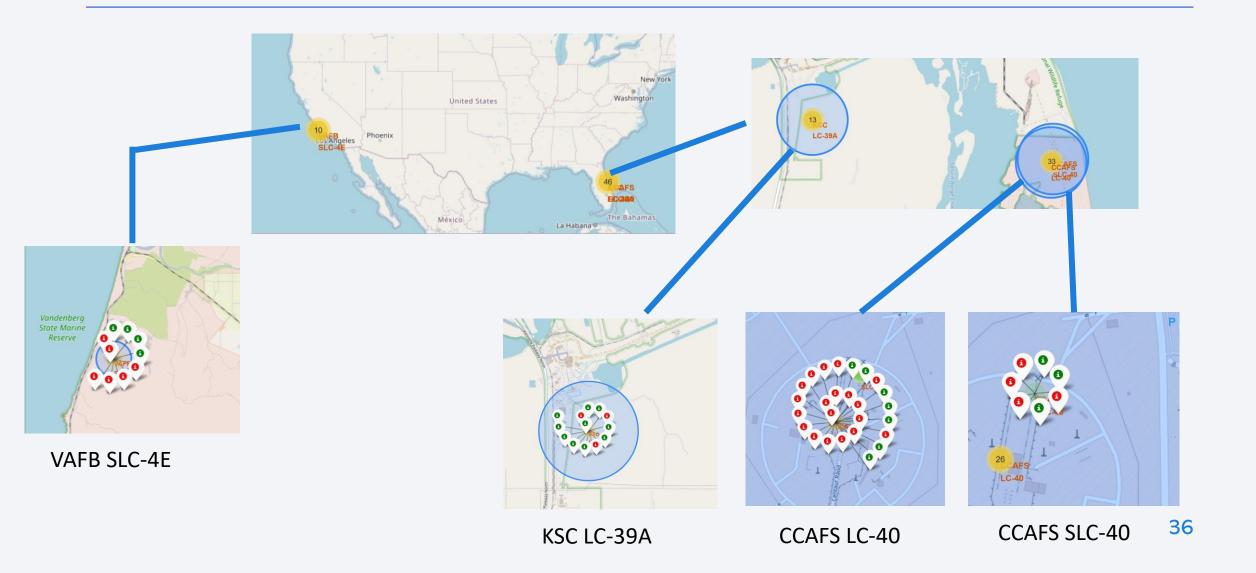

## Launch sites – general

- 1 Launch site located on the west coast and 3 on the east coast
- All Launch sites as close as possible to the equator line

#### Mission Success

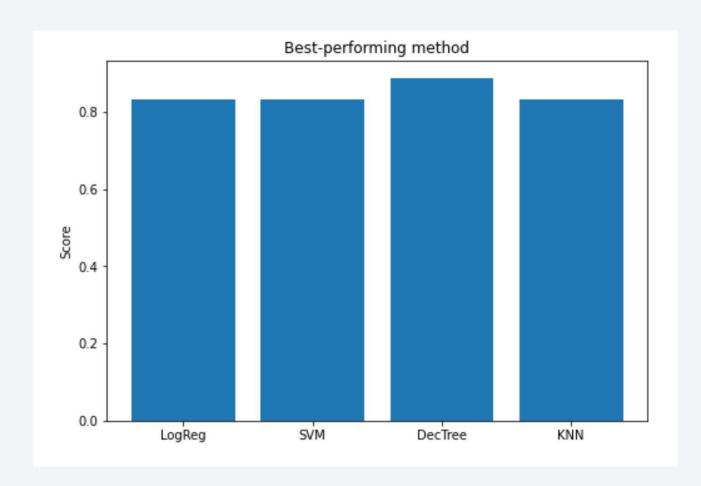

# VAFB SLC-4E proximities

 Railway, highway and coastline are all less than 1.5 km apart from the launch site.

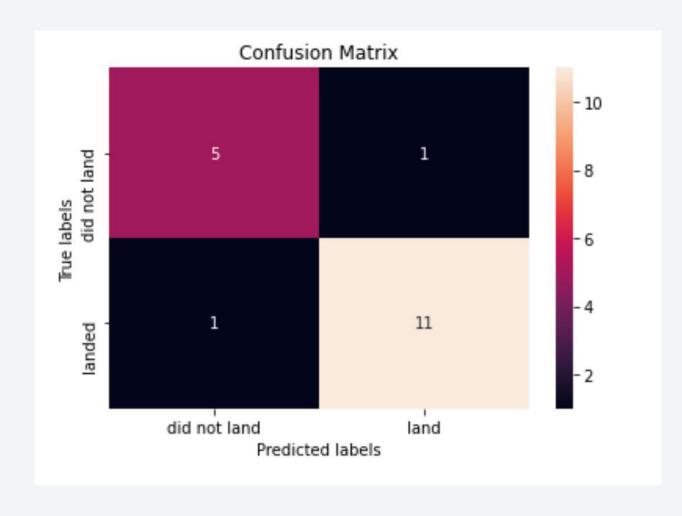

## Classification Accuracy

 The Decision Tree model is the best-suited for our dataset with an accuracy score of 0.8888

#### **Confusion Matrix**

- Successful landings:
- 11 correct
- 1 incorrect

- Unsuccessful landings:
- 5 correct
- 1 incorrect

#### **Conclusions**

- Mission success rate has increased dramatically over the past 7 years
- It is more likely to have a successful mission if you are sending heavier payloads
- Booster version must be considered when carrying payloads less than 6000 kg
- Data suggests that heaviest payloads should be launched from CCAFS SLC 40 and KSC LC 39A
- The best-suited model to predict whether a future launching would be successful or not was determined to be the decision tree classifier
